

ASSIGNMENT-1

3122 21 5001 001 Aathish Sivasubrahmanian

3122 21 5001 007 Alamelu Kannan

Case study-1 : The IPL ownerships of franchises are bought at an auction by wealthy celebrities, politicians, and entrepreneurs. Shah Rukh Khan, Preity Zinta, N. Srinivasan, Mukesh Ambani, and Sanjiv Goenka are some famous personalities who have ownership in these teams. They buy these teams by bidding in an auction. In this auction, the money is paid by the team owners to the BCCI. Therefore, this is a major source of revenue for IPL.

1. Choose the process model for the given case study and provide the justification how this model is appropriate for this case study.

Iterative Nature: The IPL ownership and auction process involves multiple iterations, with each auction representing a cycle where teams are bought, players are traded, and new strategies are devised. The Incremental Model aligns well with this iterative nature, allowing for the gradual development and refinement of the auction process over time.

Risk Management: In the context of IPL auctions, uncertainties and risks are inherent. The Incremental Model allows for the identification and management of risks at an early stage. If a particular auction season faces challenges or issues, adjustments can be made in subsequent increments to enhance the overall process.

Flexibility: The nature of IPL auctions is dynamic, with changing team compositions, player availability, and market conditions. The Incremental Model provides flexibility to adapt to changes, allowing for the incorporation of new features or modifications in response to evolving requirements.

Quick Delivery of Core Features: Each increment in the Incremental Model delivers a subset of features. In the context of IPL auctions, essential features such as bidding, team formation, and financial transactions can be implemented and delivered quickly, ensuring that the core functionalities are available early in the development process.

Client Feedback: The IPL is a highly publicized and fan-driven event. The Incremental Model facilitates regular feedback from team owners, fans, and stakeholders after each auction. This feedback loop helps in refining and improving the auction process in subsequent increments, ensuring that it aligns with the expectations and needs of the stakeholders.

Phased Implementation: The ownership and auction process involves various phases, such as team selection, player auctions, and post-auction strategies. The Incremental Model

allows for the phased implementation of these components, ensuring that each phase is thoroughly tested and validated before moving on to the next.

In conclusion, the Incremental Model is suitable for the IPL ownership and auction case study due to its iterative and flexible nature, ability to manage risks effectively, quick delivery of core features, and support for regular feedback and adjustments. This model aligns well with the dynamic and evolving requirements of the IPL auction process.

2. Use online scheduling tool and represent them.

3. List the functional requirements, non functional requirements, user requirements, and system requirements for a scenario.

- Functional Requirements:
 - Bidding System:
 - Users must have the capability to submit bids for team ownership.
 - Real-time updates on ongoing bids and information on the current leading bidders should be provided.
 - Implementation of an automatic bid incremental system to facilitate a dynamic bidding process.
 - Payment Processing:
 - Integration with secure online payment gateways to ensure the confidentiality and integrity of financial transactions.
 - Confirmation mechanisms for successful payments to provide users with transaction verification.

- Handling of failed payments with corresponding notifications to users for transparency and issue resolution.
- Ownership Transfer:
 - Automated transfer of team ownership should occur seamlessly upon successful payment.
 - Generation of legal documentation pertaining to ownership transfer for formalizing the transaction.
- Non-Functional Requirements:
 - Security:
 - Implementation of robust encryption protocols for securing all data transmissions to safeguard user information.
 - Secure storage practices must be in place to protect sensitive information from unauthorized access or breaches.
 - Mitigation of common web vulnerabilities, including but not limited to SQL injection and XSS, to fortify the system against potential security threats.
 - Performance:
 - System should handle simultaneous bids without performance degradation.
 - Payment processing should occur within seconds.
 - Usability:
 - Intuitive user interfaces for bidding and payment.
 - Multi-platform support (web and mobile).
